1 Implementation formulas of the fc-CVS-EOM-CCSD method

Notation

- I, J, ... = occupied Core orbital (very small number of orbitals - core orbitals of nuclei with different Z can be handled separately, as coupling between them is negligible)

- i_v, j_v, ... = occupied Valence orbital

- generic i, j = any occupied orbital (both core and valence)

$\mathcal{P}_+(qr)$ and $\mathcal{P}_-(qr)$ are the symmetric and antisymmetric permutation operators respectively, defined as:

$$\mathcal{P}_+(qr)f(\dots pqrs\dots) \equiv f(\dots pqrs\dots) + f(\dots prqs\dots) \tag{S1}$$

$$\mathcal{P}_-(qr)f(\dots pqrs\dots) \equiv f(\dots pqrs\dots) - f(\dots prqs\dots) \tag{S2}$$
